

Environmental Policy

Our policy is to promote improvement of the environment by minimising the consumption of natural resources and materials, maximising recycling and the use of renewable resources, whilst limiting pollution and environment disturbance in the course of our construction operations.

To achieve this we will endeavour to -

- Control and minimise the use of natural resources efficient running and maintenance of equipment and machines.
- Seek methods of working that minimise usage, limit waste and favour the use of renewable, recyclable or recycled resources.
- Encourage the recycling or reprocessing of materials on site for use elsewhere.
- Organise our operations to minimise environmental disturbance, including noise and limit pollution to earth and atmosphere by control and treatment of discharges where appropriate.
- Satisfy and improve upon if possible, the requirements of industry Codes of Practice, Government guideline and appropriate regulations. In the absence of these, set out our own environmental standards on sites and workplace.
- Recognise that, although in many instances designs, specification and working methods are outside our control, we should seek to influence them where possible.
- Inform our subcontractors and suppliers of the policy and encourage them to develop and maintain standards that comply.
- Involve employees throughout the company in the policy and foster environmental awareness and concern at all levels.

Carry out regular reviews of the policy and monitor its implementation to ensure that it reflects best practices and continues to achieve its objectives and strive for continual improvement.
